

## EMAIL INSTRUCTIONS FOR THUNDERBIRD

This is our recommended configuration for Thunderbird mail clients.

### **Incoming Server** ("Account Settings" > "Server Settings")

**Server Name:** imap.stackmail.com

**Username:** Your e-mail address

**Port:** 993

**Connection security:** SSL/TLS

**Authentication method:** 'Normal password'

### **Outgoing Server (SMTP)**

**Server Name:** smtp.stackmail.com

**Port:** 587

**Connection Security:** STARTTLS

**Authentication method:** 'Normal password'

**Username:** Your e-mail address

If you choose to use domain-branded server names, such as mail.your-domain or imap.your-domain, the secure connection may throw a certificate warning due to a common name mismatch. This can be safely trusted and your connection will remain secure.
